Kernel and Convolution:

In image processing, a **kernel**, **convolution matrix**, or **mask** is a small matrix.

It is used for **blurring**, **sharpening**, **edge detection**, and more.

Convolution is the process of adding each element of the image to its local neighbors, weighted by the **kernel**.

Convolution sign

4st National Conference On Information Technology, Computer & Telecommunication

Sobel Operator:

The operator uses two 3×3 kernels which are **convolved** with the original image

Roberts Cross:

It was one of the first edge detectors and was initially proposed by Lawrence Roberts in 1963.

$$\left[egin{array}{ccc} +1 & 0 \ 0 & -1 \end{array}
ight] \quad ext{and} \quad \left[egin{array}{ccc} 0 & +1 \ -1 & 0 \end{array}
ight]$$

Prewitt operator:

$$\mathbf{G_x} = egin{bmatrix} +1 & 0 & -1 \ +1 & 0 & -1 \ +1 & 0 & -1 \end{bmatrix} * \mathbf{A} \quad \mathrm{and} \quad \mathbf{G_y} = egin{bmatrix} +1 & +1 & +1 \ 0 & 0 & 0 \ -1 & -1 & -1 \end{bmatrix} * \mathbf{A}$$

The Laplacian of Gaussian:

One of the first and also most common **blob detectors** is based on the Laplacian of the Gaussian (LoG).

Given an input image f(x,y), this image is convolved by a **Gaussian kernel**

$$g(x,y,t) = rac{1}{2\pi t} e^{-rac{x^2+y^2}{2t}}$$

چهارمین کففرانس ملی فعاوری اطلاحات کامپیر تر و مخابرات

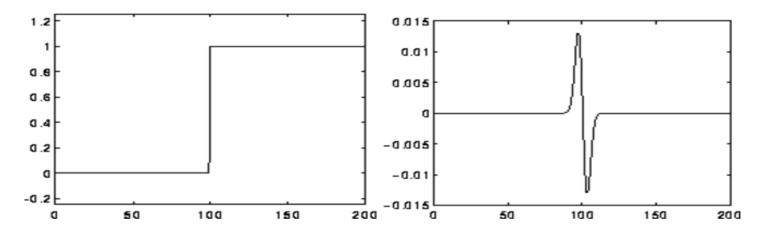

4st National Conference On Information Technology, Computer & Telecommunication

Zero Crossing Detector:

The zero crossing detector looks for places in the Laplacian of an image where the value of the Laplacian passes through zero points where the Laplacian changes sign. Such points often occur at 'edges' in images.

The core of the zero crossing detector is the Laplacian of Gaussian filter.

Response of 1-D LoG filter to a step edge. The left hand graph shows a 1-D image, 200 pixels long, containing a step edge. The right hand graph shows the response of a 1-D LoG filter with Gaussian standard deviation 3 pixels.

4th National Conference On Information Technology, Computer & Telecommunication

Canny Edge Detector:

It was developed by John F. Canny in 1986.

The Process of Canny edge detection algorithm can be broken down to 5 different steps:

- Apply Gaussian filter to smooth the image in order to remove the noise.
- Find the intensity gradients of the image.(Edges Directions Degree)
- Apply **non-maximum suppression** to get rid of spurious response to edge detection.(**Edge Thinning Technique**) indicates location with the sharpest change of intensity value
- Apply **double threshold** to determine potential edges. some edge pixels remain that are caused by noise and color variation
- Track edge by hysteresis: Finalize the detection of edges by suppressing all the other edges that are weak and not connected to strong edges.

Hit-or-Miss Transform:

- In mathematical morphology, hit-or-miss transform is an operation that detects a given pattern in a binary image
- using the morphological erosion operator and a pair of disjoint structuring elements.
- The result of the hit-or-miss transform is the **set of positions**.
- the **first** structuring element **fits** in the foreground of the input image.
- **second** structuring element **misses** it completely.

Erosion:

The basic idea in binary morphology is to **probe** an image with a simple, **pre-defined shape**, drawing conclusions on how this shape fits or misses the shapes in the image.

This simple "**probe**" is called **structuring element**, and is itself a **binary image** (i.e., a subset of the space or grid).

Validation Measures:

$$MSE = \frac{1}{M \times N} \sum_{i=0}^{N-1} \sum_{j=0}^{M-1} [X(i,j) - Y(i,j)]^{2}$$

Mean squared error = The value of MSE must be less and the **value 0** is the best, meaning there is no error. In which, X and Y are two arrays with the size of M*N.

$$\frac{\text{PSNR}}{\text{PSNR}} = 10\log_{10} \frac{\text{L}^2}{\text{MSE}}$$

Peak signal-to-noise ratio = usually between **5 to 50**. The **more this value is, the better**.

In which L determines the range of value, which a pixel could have. Its unit is DB, and has a limit of 50.

$$\frac{\text{SSIM}(x,y)}{(\mu_x^2 + \mu_y^2 + C1)(2\sigma_{xy} + C2)}$$

Structural similarity index = is a number between 0 and 1. The higher this value is, the better result exists.

SSIM is designed to improve on traditional methods like peak signal-to-noise ratio (PSNR) and mean squared error (MSE)

Conclusion:

- The proposed system is not only a **new edge detection** approach, but is able to deal with different noises in digital images, and indicate the **least of sensitivity**.
- This system does not change the **real position of the edges**.
- Presenting **promising results**, in validated visual and statistical results against other **conventional edge detection** methods
- With changing the proposed system, we are able to create a sort of image feature extraction method.
